## Fighting mites in poultry keeping

The chicken mite (red poultry mite) , the nordic brown mite (brown bird mite) and other forms play a central role in transferring infectious diseases (poultry cholera, bird flu and many more) amongst poultry.

At nighttime, mites attack the birds to suck blood. At the bite areas, inflammation and long-lasting itching occurs. Results are:

### reduced growing, fattening and laying performance

Bad results in fighting mites often are results of not considering the natural behavior of mites.

After sucking blood, mites hide in refuges such as laying-nests, cracks, joints and scratches on ceilings and walls. Mites are able to hunger for up to three months.

With end of a growing, or laying period, the mites leave the stable to hide in cracks and crevices that are usually well out of reach, just to return to the stable when it is warmed up again for the next population of incoming poultry.

The product **VENNO<sup>®</sup> VM** have effectiveness in their respective solutions as a contact agent. This means, for maximum results in fighting mites, it must be ensured that the active ingredients reach the mites. Consequently, it is important to remove dirt and dust from the surfaces intended for treatment, in order to avoid reduction of effectiveness.

**VENNO<sup>®</sup> VM** has to be used in an empty, depopulated animal house. No direct treatment of animals! When treated in the described application, the product has no harmful residue on the surface.

## VENNO<sup>®</sup> VM is working against red poultry mites

### Concentration:

2 % solution

200 ml product in 10 ltr. water

### Volume:

0,2 ltr./m<sup>2</sup> (of the solution)

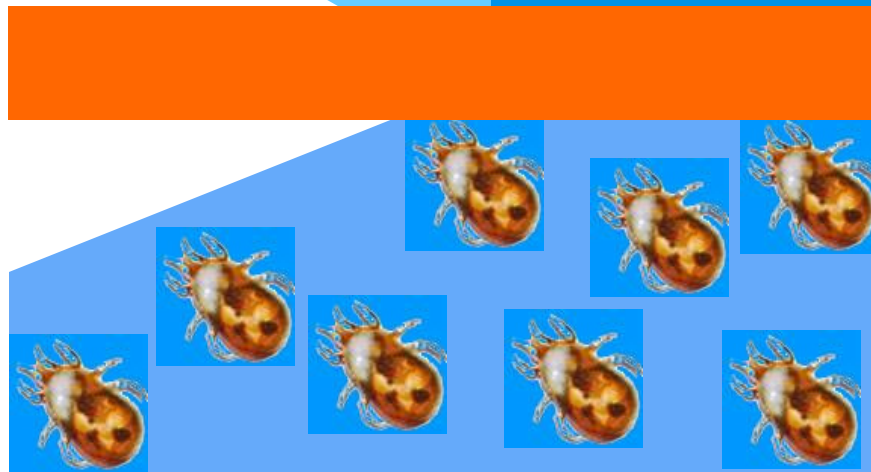

### Application:

Application with pressure and by width jet.

The treated surfaces must be soaking wet.

Nests of mites must be soaking wet. Remove dirt and dust.

Repeat treatment after 6-8 days.

Red poultry mite, *Dermanyssus gallinae*, 0,7 mm long, yellow till brown, after sucking red till black
